IT Service Desk Analytics

Ticket Resolution, SLA Compliance & Bottleneck Analysis

Data note: This report analyzes synthetic portfolio data, not records from a real company. SLA thresholds are illustrative assumptions.

1. Executive Summary

The sample contains **3,000 tickets** from January through September 2026. There are **2,853 resolved** and **147 open** tickets. Overall SLA compliance is **69.4%**. Average resolution time among resolved tickets is **15.58 hours**, with a median of **11.21 hours**.

2. Key Metrics

Metric	Result
Total tickets	3,000
Resolved tickets	2,853
Open tickets	147
SLA compliance	69.4%
Average resolution time (resolved only)	15.58 hours
Median resolution time (resolved only)	11.21 hours

3. Bottleneck Findings

Issue category	Tickets	Avg. resolution (h)	SLA breach (%)
Network	608	22.48	48.8%
Software/Application	650	21.98	46.6%
Hardware	408	18.91	34.6%
Other	315	11.02	20.3%
Email	354	8.36	13.8%
Access/Login	665	7.25	9.8%

4. Recommended Actions

• Review the issue categories with the highest SLA breach rates and sample the underlying tickets to determine recurring causes.

• Create an early-warning queue for tickets nearing their SLA deadline, prioritized by severity and remaining time.

• Compare team workload, ticket complexity, and assignment patterns before reallocating work; ticket volume alone is not enough.

• Track SLA compliance and backlog weekly, then evaluate changes using comparable time periods.

5. Interpretation & Limitations

All metrics and findings are derived from a reproducibly generated synthetic dataset. They demonstrate an analytical workflow but do not prove that any real company has these exact problems or would achieve a specific improvement. Before making operational decisions, repeat the analysis with authorized real ticket data and validate the SLA definitions with the organization.
